                                                                                                                                                                                                                                                                                                                             EQUENCE FROM N.A.
DEVELOPMENTAL STAGE: There is one major 'early' isoform ar multiple 'late' isoforms. Around 50 isoforms are found at different developmental stages.

PTM: N-glycosylated and O-glycosylated.

PTM: May be proteolytically cleaved at Arg-636.

SIMILARITY: Belongs to the immunoglobulin amonfolia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        389

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MATURE CIRCUITS IN THE LIMBIC SYSTEM. ESSENTIAL FOR NORMAL GROW OF THE HYPPOCAMPAL MOSSY FIBER PROJECTION (BY SIMILARITY).
SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.
TISSUE SPECIFICITY: Expressed on limbic neurons and fiber tract
as well as in single layers of the superior colliculus, spinal
chord and cerebellum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chord and cerebellum. SIMILARITY: Belongs to the immunoglobulin superfamily. IgLON \,

                                                                                                                                                                                                                                                                                                                                                                                                                                         A Dirks P., Montag-Sallaz M., Montag D.;

"Expression patterns of L1-family cell recognition molecules L1, CHL1,

"I recam, and neurofascin in the mouse brain.";

I NrCAM, and neurofascin in the mouse brain.";

Submitted (FEB-2003) to the EMBL/GenBank/DDBJ databases.

C -!- FUNCTION: Cell adhesion, ankyrin-binding protein which may be involved in neurite extension, axonal guidance, synaptogenesis,

C myelination and neuron-gilal cell interactions (By similarity).

C -!- SUBUNIT: Probable constituent of a neurofascin/NRCAM/ankyrin G complex. Associates with the sodium channel beta-1 (SCN1B) and beta-3 (SCN1B) subunits (By similarity).

C -!- SUBCELLULAR LOCATION: Type I membrane protein.

C -!- SUBCELLULAR LOCATION: Type I membrane protein.

C -!- SUBCELLULAR LOCATION: Type I membrane protein.

C -!- SUBCELLULAR LOCATION: Type I membrane protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SUBCELLULAR LOCATION: Type I membrane protein (Potential at podocyte slit diaphragm between podocyte foot process ITSSUB SPECIFICITY: Expressed in kidney glomeruli.

PTM: Phosphorylated on tyrosine residues (By similarity)
SIMILARITY: Belongs to the immunoglobulin superfamily.
SIMILARITY: Contains 8 immunoglobulin-like domains.
SIMILARITY: Contains 1 fibronectin type III domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: Seems to play a role in the development or the kidney glomerular filtration barrier. May anchor slit diaphragm to the actin cytoskeleton. SUBUNIT: Interacts with podocin/NPHS2 and with CD2AP domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            J. Pathol. 159:2303-2308(2001).

IsoId=Q05695-2; Sequence=VSP 002592;
IsoId=Q05695-2; Sequence=VSP 002592;
-!- TISSUE SPECIFICITY: Isoform 2 is predominantly found in the peripheral nervous systwhile isoform 1 is found in the peripheral nervous systwhile isoform 1 is found in the peripheral nervous system.
-!- SIMILARITY: Belongs to the immunoglobulin superfamily.
-!- SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
-!- SIMILARITY: Contains 5 fibronectin type III domains.
                                                                                                                                                      CARBOHYD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL; X59149; CAA4180

CONTRIBUTES TO THE GUIDANCE OF DEVELOPING AXONS AND REMODELLING OF MATURE CIRCUITS IN THE LIMBIC SYSTEM. ESSENTIAL FOR NORMAL GROWTHE HYPOTAMPAL MOSSY FIBER PROJECTION.

SUBGELLULAR LOCATION: Attached to the membrane by a GPI-anchor. TISSUE SPECIFICITY: Expressed mostly by neurons comprising limbic associated cortical and subcortical regions that function in cognition, memory, and learning. AT STAGE E20 IT IS DEVELOPMENTAL STAGE: FIRST DETECTED AT E15-16, AT STAGE E20 IT IS DEVELOPMENTAL STAGE: FIRST DETECTED AT E15-16 AREAS OF THE THALAMUS AND HYPOTHALAMUS. IN THE ADULT, IT IS FOUND IN HYPOTHALAMUS, PERIRHINAL CORTEX, AMYGDALA AND MEDIAL THALAMIC THALAMUS, PERIRHINAL CORTEX, AMYGDALA AND MEDIAL THALAMIC

"Sodium channel betal and beta3 subunits associate with neurofascin
through their extracellular immunoglobulin-like domain.";
J. Cell Biol. 154:427-434 (2001).

-!- FUNCTION: Cell adhesion, ankyrin-binding protein which may be
involved in neurite extension, axonal guidance, synaptogenesis,
myelination and neuron-glial cell interactions. Isoforms 2/3 may
be responsible for mediating and signaling axon-glial interaction
                                                                                                                                                                                                                                                                                           Event-Alternative splicing; Named isoforms=3;
Name=1; Synonyms=NF186, 186 kDa isoform;
IsoId=P97685-1; Sequence=Displayed;
Name=2; Synonyms=NF155, 155 kDa isoform;
IsoId=P97685-2; Sequence=VSP_050416, VSP_050417, VSP_050418,
VSP_050419;
Name=3; Synonyms=NF155, 155 kDa isoform;
IsoId=P97685-3; Sequence=VSP_050416, VSP_050417, VSP_08411,
VSP_050418, VSP_050419;
-!- TISSUE SPECIFICITY: Isoform 1 is expressed at Nodes of Ranvier while isoform 2/3 is expressed in unmyelinated axons.
-!- DEVELOPMENTAL STAGE: Strongly but transiently up-regulated in oligodendrocytes at the onset of myelinogenesis. Once these last have engaged their target exons, expression declines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Tait S., Gunn-Moore F., Collinson J.M., Huang Pedraza L., Sherman D.L., Colman D.R., Brophy "An oligodendrocyte cell adhesion molecule at the paranodal axo-glial junction.";

SUBUNIT: Probable constituent of a neurofascin/NRCAM/ankyrin G
complex. Associates with the sodium channel beta-1 (SCN1B) and
beta-3 (SCN3B) subunits. Associates to beta-1 subunit in
developing axons as early as postanatal day 5, during the period
that nodes of Ranvier are forming. Isoform 2/3 is likely to
interact with axonal proteins in close association with CNTNAP1.
SUBCELIULAR LOCATION: Type I membrane protein. Isoform 1
colocalizes with ankyrin G at the nodes of Ranvier. Isoform 2/3 is
a glial component of the paranodal axo-glial junction.
